Seeking a Software Developer position in Lexington, KY

COVER

To whom it may concern:

During my time at iEntry, Inc. I work on nearly every critical company application and server including several web farms, database servers, proxy servers, MTA servers, and virtual servers. These servers run various flavors of Linux and Windows. I am in charge of several tools used by many of the employees including Wordpress and several custom-built applications critical to company functions. I also manage many desktop Mac installations running OS X and Windows. I helped design several new tools for other employees such as a statistcal application and modifications to previous tools.

I spent two years in Desktop Support and Technical Helpdesk at the University of Kentucky. In this position, I supported Microsoft Windows (XP, 7, and 8), Mac OSX, and Linux Operating systems. In the position, I gained extensive knowledge of the Microsoft Office Suite and Microsoft Exchange. I helped manage a user base of over 500+ desktops across campus and often worked directly with users via our ticketing system, email, over the phone, and most often in person.

As a student, I worked with a team of 4 to develop a cloud-based application constructed on Amazon Web Services. We used the web framework, Django in concert with MySQL and MongoDB. This application used API's to access health data from personal health services. We visualized this data via a jQuery application.

Regards,

Alex Johnson
